# TikZ commends tutorial

Yi-Chen Zhang

January 4, 2018

The TikZ commands can be inside the environment \begin{tikzpicture} ... \end{tikzpicture} or simply use \tikz clause. We run pdflatex or latex followed by dvips to execute the TikZ commends.

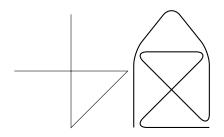

# 1 Preliminary

# 1.1 Straight Path Construction

```
Useage:
```

```
\frac{(x1,y1) -- (x2,y2) -- (x3,y3)}{}
```

## Example:

## 1.2 Circle Path Construction

```
Usage:
```

```
\draw[options] (x,y) circle (raidus);
\draw[options] (x,y) ellipse (x.raidus anda y.radius);
```

```
\draw (0,0) circle (2pt);
\draw[red] (1,0) circle (3pt);
\draw[fill=red] (2,0) circle (4pt);
\draw[red,fill=red] (3,0) ellipse (10pt and 5pt);
\filldraw[blue,rotate=30] (3.5,-2) ellipse (10pt and 5pt);
```

# 1.3 Curved Path Construction

```
Usage:
```

```
\draw[options] (x1,y1) .. controls (x2,y2) and (x3,y3) .. (x4,y4)

Example:
\filldraw[gray] (0,0) circle (2pt) (1,1) circle (2pt)
(2,1) circle (2pt) (2,0) circle (2pt);
\draw (0,0) .. controls (1,1) and (2,1) .. (2,0);
```

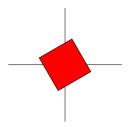

# 1.4 Rectangle Path Construction

### Usage:

```
\draw[options] (x1,y1) rectangle (x2,y2);
```

# Example:

```
\draw (-1.5,0) -- (1.5,0);
\draw (0,-1.5) -- (0,1.5);
\draw[rotate=30, fill=red] (-0.5,-0.5) rectangle (-1,-1);
```

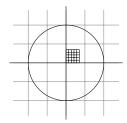

# 1.5 Grid Path Construction

### Usage:

```
\draw[options] (x1,y1) grid (x2,y2);
```

```
\draw[step=.5cm, gray, very thin] (-1.4,-1.4) grid (1.4,1.4);
\draw (-1.5,0) -- (1.5,0);
\draw (0,-1.5) -- (0,1.5);
\draw (0,0) circle (1cm);
\draw[step=2pt] (0,0) grid (10pt,10pt);
```

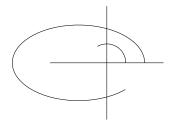

#### 1.6 Arc Path Construction

```
Usage:
```

```
\draw (x,y) arc (angle1:angle2:radius)
\draw (x,y) arc (angle1:angle2:x.radius and y.radius)
```

### Example:

```
\draw (-1.5,0) -- (1.5,0);
\draw (0,-1.5) -- (0,1.5);
\draw (0.5,0) arc (0:120:0.5cm);
\draw (1,0) arc (0:315:1.75cm and 1cm);
```

# 1.7 Drawing Options

There are some drawing options that one can use to control the color, thickness, and line type.

- thickness: ultra thin \_\_\_, very thin \_\_\_, thin \_\_\_, semithick \_\_\_, thick \_\_\_, very thick \_\_\_, ultra thick \_\_\_.
- line type: loosely dashed \_ \_ , dashed \_ \_ , densely dashed \_ \_ , loosely dotted \_ \_ , dotted \_ \_ , densely dotted \_ \_ . . . .

#### Usage:

```
\draw[color, thickness, line type] (x1,y1) -- (x2,y2);
```

#### Example:

```
\draw[red, very thin, densely dashed] (0,0) -- (0.9,0);
\draw[blue, ultra thick, loosely dotted] (1.1,0) -- (2,0);
\draw[green, semithick] (2.1,0) -- (2.9,0);
```

# 1.8 Adding a Touch Style

Styles are predefined sets of options that can be used to organize how a graphic is drawn. To define a style globally, we can use the \tikzset command at the beginning of the document.

#### Usage:

```
\tikzset{style_name./style={options}}
```

```
\tikzset{blue_thin_lines/.style={color=blue!50,very thin}}
```

```
\begin{tikzpicture}
  \draw[blue_thin_lines] (0,0) grid (5,5);
\end{tikzpicture}
```

To define a style locally, we use a pair of square bracket "[]" to define styles at the beginning of a picture.

#### Usage:

```
[style_name/.style={options}]
```

### Example:

```
\begin{tikzpicture}
  [red_thick_lines/.style={color=red!50,very thick}]
  \draw[step=0.5cm, red_thick_lines] (0,0) grid (2,2);
\end{tikzpicture}
```

One can also define styles hierarchically.

#### Usage

```
\tikzset{style_name1/.style={style_name2, options}}
```

### Example:

```
\tikzset{green_help_lines/.style={help lines, color=green!90}}
\begin{tikzpicture}
  \draw[step=0.5cm, green_help_lines] (0,0) grid (5,5);
\end{tikzpicture}
```

Styles can also be used with a parameter.

#### Usage:

```
[style_name/.style={options}, style_name/.default={options}]
```

```
begin{tikzpicture}
  [para_color/.style={help lines,color=#1!50}, para_color/.default=blue]
  \draw[step=0.5cm, para_color] (0,0) grid (2,2);
  \draw[step=0.5cm, para_color=red] (2,0) grid (4,2);
  \end{tikzpicture}
```
